Emotional Exhaustion Among US Health Care Workers Before and During the COVID-19 Pandemic, 2019-2021

J. Bryan Sexton, PhD; Kathryn C. Adair, PhD; Joshua Proulx, BSEE; Jochen Profit, MD; Xin Cui, PhD; Jon Bae, MD; Allan Frankel, MD

Abstract

**IMPORTANCE** Extraordinary strain from COVID-19 has negatively impacted the well-being of health care workers (HCW).

**OBJECTIVE** To determine whether HCW emotional exhaustion increased during the COVID-19 pandemic, for which roles, and at what point.

**DESIGN, SETTING, AND PARTICIPANTS** This survey study used an electronic survey administered in September 2019, September 2020, and January 2022. Participants included hospital-based HCWs in clinical (nurses, physicians, and other health care workers) and administrative support roles at 76 community hospitals within 2 large health systems.

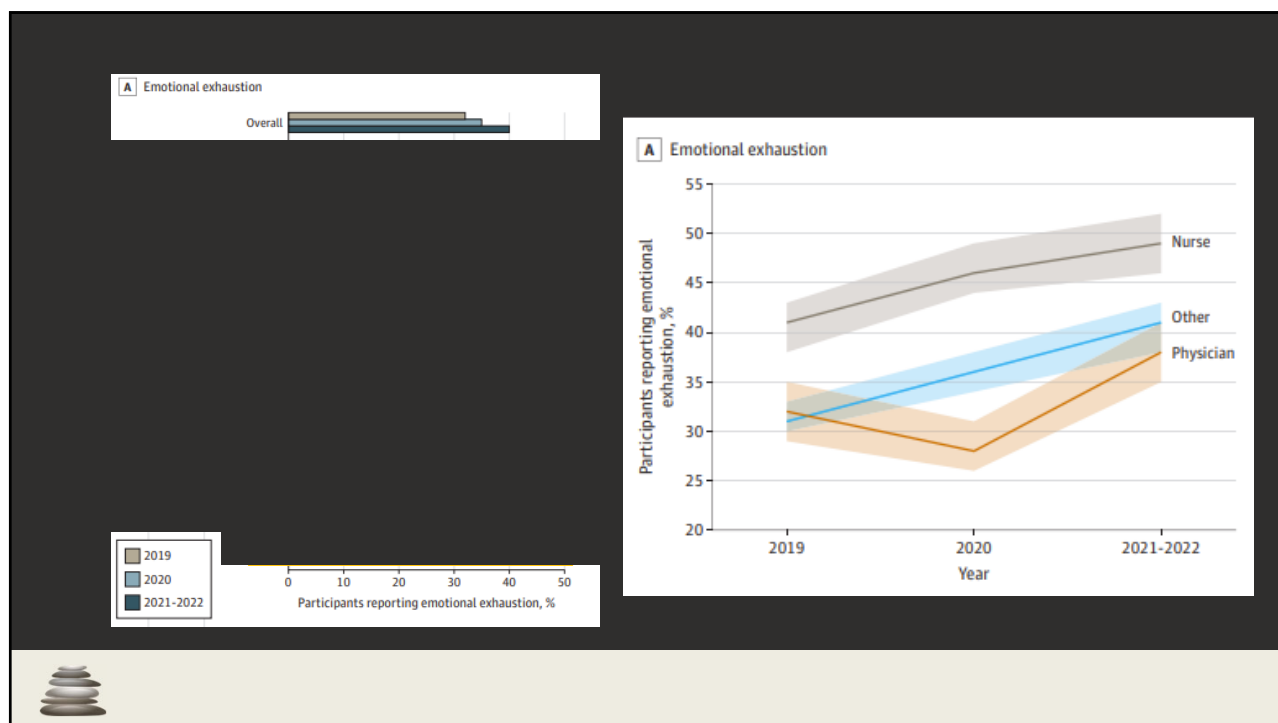

**EXPOSURES** Safety, Communication, Organizational Reliability, Physician, and Patient Engagement (SCORE) survey domains of emotional exhaustion and engagement climate.

**MAIN OUTCOMES AND MEASURES** The percentage of respondents reporting emotional exhaustion (%EE) in themselves and a climate of emotional exhaustion in their colleagues. Survey items were answered on a 5-point scale from 1 (strongly disagree) to 5 (strongly agree); neutral or higher scores were counted as "percent concerning" for each item.

**RESULTS** Electronic surveys were returned by 37 187 (of 49 918) respondents in 2019, 38 460 (of 45 268) in 2020, and 31 475 (of 41 224) in 2021 to 2022 for overall reported rates of 74.5%, 85.0%, and 76.4%, respectively. The overall sample comprised 107 122 completed surveys. Nursing was the most frequently reported role (n = 43 918 [40.9%]). A total of 166 respondents (16.9%) reported less than 1 year at their facility, 59 226 (56.2%) reported 1 to 10 years, and 28 337 (26.9%) reported 11 years or more. From September 2019 to September 2021, overall %EE increased from 31.8% (95% CI, 30.0%-33.7%) to 40.4% (95% CI, 38.1%-42.8%), with a proportional increase in %EE of 26.9% (95% CI, 23.3%-31.8%). Physicians had a decrease in %EE from 31.8% to 28.1% (95% CI, 26.4%-29.8%), while nurses had an increase in %EE from 31.8% to 40.4% (95% CI, 38.1%-42.8%).

From September 2019 to September 2021, overall %EE increased from 31.8% to 40.4% with a proportional increase in %EE of 26.9%

9

10

11

## 5-item Validated Emotional Exhaustion Metric

Please answer the following items with respect to your specific work setting.  
Choose your responses using the scale below:

A(1)	B(2)	C(3)	D(4)	E(5)	X
Disagree Strongly	Disagree Slightly	Neutral	Agree Slightly	Agree Strongly	Not Applicable
Events in this work setting affect my life in an emotionally unhealthy way.					A B C D E X
I feel burned out from my work.					A B C D E X
I feel fatigued when I get up in the morning and have to face another day on the job.					A B C D E X
I feel frustrated by my job.					A B C D E X
I feel I am working too hard on my job.					A B C D E X

Averages near:  
3 ("C" or Neutral) considered mild burnout  
4 ("D" or Agree Slightly) considered moderate burnout  
5 ("E" or Agree Strongly) considered severe burnout

Sexton et al., 2017; Schwartz et al., 2018; Adair et al., 2018; Adair et al., 2020;

# What Causes Burnout? What Prevents it?

## Causes

### Overload:

- Excessive workloads; long hours, administrative burden
- Complex and critical patients

### Unmet psychological needs:

- Lack of autonomy/control, organizational/leader support, not seen/heard/valued, moral injury

### Workplace culture & environment

- Disruptive behaviors (violence, incivility, aggressions)
- “Badge of honor” culture/infallibility

### Work-life imbalance; personal stressors

## Prevention/Interventions

### Overload:

- Good workflow/systems, reduce unnecessary meetings/task;
- Adequate staffing and resources; flex scheduling

### Psychological needs met:

- Meaning/purpose in work
- Leadership support and visibility; autonomy given

### Workplace culture & environment

- Strong teamwork and relationships
- Team members are valued, wins celebrated
- Well-being is part of the culture (PTO, breaks); resources provided
- Disruptive behaviors addressed

### Supportive personal systems/people/resources

# Positive Leader WalkRounds

The Joint Commission Journal on Quality and Patient Safety 2021; 000:1–9

## Safety Culture and Workforce Well-Being Associations with Positive Leadership WalkRounds

J. Bryan Sexton, PhD; Kathryn C. Adair, PhD; Jochen Profit, MD; Jonathan Bae, MD; Kyle J. Rehder, MD; Tracy Gosselin, PhD, RN; Judy Milne, RN; Michael Leonard, MD; Allan Frankel, MD

**Background:** Interventions to decrease burnout and increase well-being in health care workers (HCWs) and improve organizational safety culture are urgently needed. This study was conducted to determine the association between Positive Leadership WalkRounds (PosWR), an organizational practice in which leaders conduct rounds and ask staff about what is going well, and HCW well-being and organizational safety culture.

**Methods:** This study was conducted in a large academic health care system in which senior leaders were encouraged to conduct PosWR. The researchers used data from a routine cross-sectional survey of clinical and nonclinical HCWs, which included a question about recall of exposure of HCWs to PosWR: “Do senior leaders ask for information about what is going well in this work setting (e.g., people who deserve special recognition for going above and beyond, celebration of successes, etc.)?”—along with measures of well-being and safety culture. *T*-tests compared work settings in the first and fourth quartiles for PosWR exposure across SCORE (Safety, Communication, Operational Reliability, and Engagement) domains of safety culture and workforce well-being.

**Results:** Electronic surveys were returned by 10,627 out of 13,040 possible respondents (response rate 81.5%) from 396 work settings. Exposure to PosWR was reported by 63.1% of respondents overall, with a mean of 63.4% (standard deviation = 20.0) across work settings. Exposure to PosWR was most commonly reported by HCWs in leadership roles (83.8%). Compared to work settings in the fourth (< 50%) quartile for PosWR exposure, those in the first (> 88%) quartile revealed a higher percentage of respondents reporting good patient safety norms (49.6% vs. 69.6%,  $p < 0.001$ ); good readiness to engage in quality improvement activities (60.6% vs. 76.6%,  $p < 0.001$ ); good leadership accessibility and feedback behavior (51.9% vs. 67.2%,  $p < 0.001$ ); good teamwork norms (36.8% vs. 52.7%,  $p < 0.001$ ); and good work-life balance norms (61.9% vs. 68.9%,  $p = 0.003$ ). Compared to the fourth quartile, the first quartile had a lower percentage of respondents reporting emotional exhaustion in themselves (45.9% vs. 32.4%,  $p < 0.001$ ), and in their colleagues (60.5% vs. 47.7%,  $p < 0.001$ ).

**Conclusion:** Exposure to PosWR was associated with better HCW well-being and safety culture.

- From your perspective, could you share three things that are going well in this work setting, and one thing that could be better?
- Is there anyone you would like to give a shout-out to today, and can you elaborate with specific examples?
- Are there any celebrations of success, in your opinion, that you could share?
- Who do you think deserves special recognition for going above and beyond in their role?

Abstract

**Objective** Test web-based implementation for the science of enhancing resilience (WISER) intervention efficacy in reducing healthcare worker (HCW) burnout.

**Design** RCT using two cohorts of HCWs of four NICUs each, to improve HCW well-being (primary outcome: burnout). Cohort 1 received WISER while Cohort 2 acted as a waitlist control.

**Results** Cohorts were similar, mostly female (83%) and nurses (62%). In Cohorts 1 and 2 respectively, 182 and 299 initiated WISER, 100 and 176 completed 1-month follow-up, and 78 and 146 completed 6-month follow-up. Relative to control, WISER decreased burnout (−5.27 (95% CI: −10.44, −0.10),  $p = 0.046$ ). Combined adjusted cohort results at 1-month showed that the percentage of HCWs reporting concerning outcomes was significantly decreased for burnout (−6.3% (95% CI: −11.6%, −1.0%);  $p = 0.008$ ), and secondary outcomes depression (−5.2% (95% CI: −10.8, −0.4);  $p = 0.022$ ) and work-life integration (−11.8% (95% CI: −17.9, −6.1);  $p < 0.001$ ). Improvements endured at 6 months.

**Conclusion** WISER appears to durably improve HCW well-being.

**Clinical Trials Number** NCT02603133; <https://clinicaltrials.gov/ct2/show/NCT02603133>

Introduction

Burnout among HCWs has been linked to adverse patient

## If I'm Self-compassionate I'm Not Going to be Motivated to Improve!

### Self-Compassion Increases Self-Improvement Motivation

Personality and Social  
Psychology Bulletin  
38(9) 1133-1143

Juliana G. Breines<sup>1</sup> and Serena Chen<sup>1</sup>

#### Abstract

Can treating oneself with compassion after making a mistake increase self-improvement motivation? In four experiments, the authors examined the hypothesis that self-compassion motivates self-improvement. Participants in a self-compassion condition compared to a self-esteem control condition and either no intervention or a positive distraction control condition reported greater incremental beliefs about a personal weakness (Experiment 1); reported greater motivation to make an effort and avoid repeating a recent moral transgression (Experiment 2); spent more time studying for a difficult test following an initial failure (Experiment 3); exhibited a preference for upward social comparison after reflecting on a personal weakness (Experiment 4); and reported greater motivation to change the weakness (Experiment 4). These findings suggest that, somewhat paradoxically, taking an accepting approach to personal

Participants randomized to self-compassion condition were more motivated to improve themselves and took more self-improvement actions.

- Motivation resulting from self-criticism comes from fear of not being good enough
- Motivation resulting from SC comes from a desire for health and well-being

37

## Things to do to Build Team Self-compassion

- Model vulnerability (esp. leaders)
- Discuss mistakes as learning opportunities
- Increase psychological safety
- Talk about well-being; raise awareness of resources
- Model and support well-being behaviors (breaks, lunch, using PTO)
- Peer Support
- Engage in team well-being behaviors ("1 Good Thing" during huddles; free Duke WELL-B course as team)

38
